

ABSTRACT

An analysis apparatus capable of normally creating image data and an analysis disc used for this. Instead of using
5 a signal which has been read in time series by pickup following
a track so as to create an image by utilizing address information
engraved on an optical disc, a mark (110) is recorded over
the radius direction (A) of a read area (109) of the analysis
disc (108) where an analysis object (B) is arranged, at least
10 at a preceding position or a following position of the read
area (109) in the rotation direction (C), so that video
processing aligned according to this mark is executed, thereby
executing video acquisition or a shape count with a high
accuracy.
